Synchro Planning Level Analysis per the NCDOT Capacity Analysis Guidelines

Michael P. Reese, PE, CPM

NCDOT Congestion Management Section

NCDOT Congestion Management

The mission of the NCDOT Congestion Management Section is the statewide application of cost-effective traffic engineering based operational and safety improvement strategies which mitigate the impacts of traffic congestion, improve system efficiency, enhance traveler safety, and improve economic vitality.

The vision of the NCDOT Congestion Management Section is optimal system-wide mobility.

NCDOT Congestion Management Capacity Analysis Guidelines

Introduction/Purpose

This document provides standard values to ensure consistent traffic analysis. Deviation from these practices requires justification. By reviewing reports, plans, and submittals, the North Carolina Department of Transportation (NCDOT) in no way relieves the analyst of possible claims or additional work resulting from errors or omissions.

Pre-Analysis

Submittal Document Requirements

The submitted traffic analysis document should include, but is not limited to: a summary of the analysis and results, site plans, traffic counts and forecasts, volume generation, any assumptions used in the analysis, and any variations from these guidelines.

In other words, use the defaults or explain and justify prior to submitting analysis

TIA	TIP
Summary of Results	Summary of Results
Site Plan	Traffic Forecasts
Traffic Counts and Forecasts	Traffic Breakouts (Existing, No Build, Build
Existing Lane Diagram	Traffic Adjustments and Reroutes)

Capacity Analysis Tool Selection Guidance

- Planning-level analysis
 - results provide estimates of expected performance and are useful in informing the initial feasibility and high-level design features.
- HCM analysis
 - balances operational detail with reasonable data input needs and analysis resource requirements.
 - may provide insight on additional geometric design and signal timing details
- Microsimulation analysis
 - allows for flexible customization and configuration of geometry, signal timing, and other operational parameters.
 - provides visualization of traffic patterns and roadway geometry

Slide Data Courtesy Kittelson & Associates, Inc.

Levels of Planning Analysis from HCM

- High level
 - Large analysis area
 - Low detail
- Medium level
 - Focus on a single roadway facility, segment, or intersection
 - Greater detail
- Low level
 - Highly focused and highly detailed

Slide Data Courtesy Kittelson & Associates, Inc.

NCHRP Report 825

Slide Data Courtesy Kittelson & Associates, Inc.

Seven Step Process of Synchro and SimTraffic Planning Level Analysis

Step 1: Model Network

- Include all study intersections
- Accurately model distance between intersections
- Include future lane/intersection improvements from other developments or projects
- Y-Line lengths should be close to 1000' in order to view full queue lengths
- Code storage lengths correctly
 - Use 100' tapers
- Use cardinal directions (N, S, E, W, not NW, SE, etc.)
- Reduced Conflict Intersections (RCUT) in Synchro should be modeled using one-way pairs (check with CMS for guidance)

Step 2: Follow Analysis Guidelines

- Use NCDOT Capacity Analysis Guidelines Provided by Congestion Management, for example...
- Turn Lane Treatment
 - No protected-permitted lefts
 - No right turns on red
- Recommended Timing Settings
 - Minimum initial green time, yellow time, all-red time, lost time adjustment, minimum split
- Minimum Cycle Length
 - Based on number of phases in the signal
- Use a Peak Hour Factor (phf) of 0.9 except for near schools where 0.5 to 0.75 is commonly used (check with MSTA or CMS)

Step 3: Create Synchro File for Each Scenario

- A separate file should be created for both AM and PM peak hours for each scenario
 - Existing No Build
 - Future Year No Build
 - Future Year Build
 - Others as Needed
- Each file should have matching corridor and Y-line lengths or else simulations will not match!

Step 4: Input Volumes

- Input turning movement volumes into the corresponding file for each scenario
- In Synchro, use 4 vph as a minimum turning movement volume for any permitted movement

Step 4: Input Volumes

- Balance volumes and/or explain discrepancies between intersections within reason (check with CMS)
 - Look at what's between the intersections
 - More development = More volume drops or gains
 - Less development = Less volume drops or gains

$$\frac{A+B+C \approx X+Y+Z}{\text{Balanced}}$$

Step 5: Optimize Signal Timing

- Optimize Signal Cycle Lengths
 - Make sure to stay above minimums in Guidelines
- Optimize Splits
- If There are Multiple Signals within the network:
 - Should be coordinated if appropriate
 - If coordinated:
 - Optimize network cycle lengths, all cycle lengths should be the same or half cycle
 - Optimize network offsets
- Ensure analysis matches Capacity Analysis Guidelines
- Run “Coding Error Check” in Synchro before Simulation

Step 6: Take Note of MOEs

- Synchro Analysis:
 - Record overall intersection LOS and delay for signalized intersections
 - Record approach, and/or movement, LOS and delay for each leg of the intersection
 - Record 95th percentile queue lengths for each approach
- Create a table showing MOEs (Measures of Effectiveness e.g. LOS, delay, queuing, v/c, etc.)

Step 7: Run SimTraffic Simulation

- SimTraffic should always be run when using Synchro as an analysis tool
- Set seeding time to at least 10 minutes and recording time to 60 minutes
- Record simulation (10 runs is recommended)
- Print queuing and blocking report for the whole network
 - Should be included with analysis document appendix
 - Make a table recording SimTraffic maximum queue lengths
- **Lanes and storage recommendations should be higher of Synchro 95th and SimTraffic Maximum Queues (iteration may be necessary). Ensure recommended lanes and storage are coded.**

Planning Level Capacity Analysis of Existing Intersection in Synchro and SimTraffic

Synchro Basics:

- You can pan screen / drag map by clicking scroller button on your mouse

ADD LINK- Use to add a street to your network

Map View- Returns you to this view

Use this Display Results tabs to show different things on the map. Such as: input traffic volumes, speed, link length, volume balancing, etc.

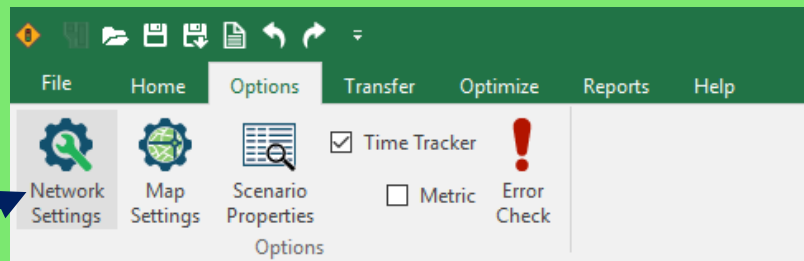

1

Start by changing network settings to match our guidelines

1. Go to Options
2. Click Network Settings

2

Change Default Settings for These:

Network Settings

You can add a background map image if you like

File Home Options Transfer Optimize Reports Help

Create Bing Region

Map View Select Background Mapping

Drag Map Select Region Zoom In Zoom Out

Find your wanted location:

- Drag to area or use search bar to type in an address
- Once you find your wanted background image, click “Select Region”
- Draw a box around wanted region then click on a reference point (a reference point helps when the Synchro network is already drawn). Click “Next”
- If no network is already drawn, then leave world coordinates at 0,0 and click “Ok”
- Now you have a map as a background
- If you don’t see your map, click this button:

Simulation Settings F10
Move M
Delete Del
Merge Template

This is a node. They are at the end of links and at intersections. You can move them by right-clicking and clicking "Move"

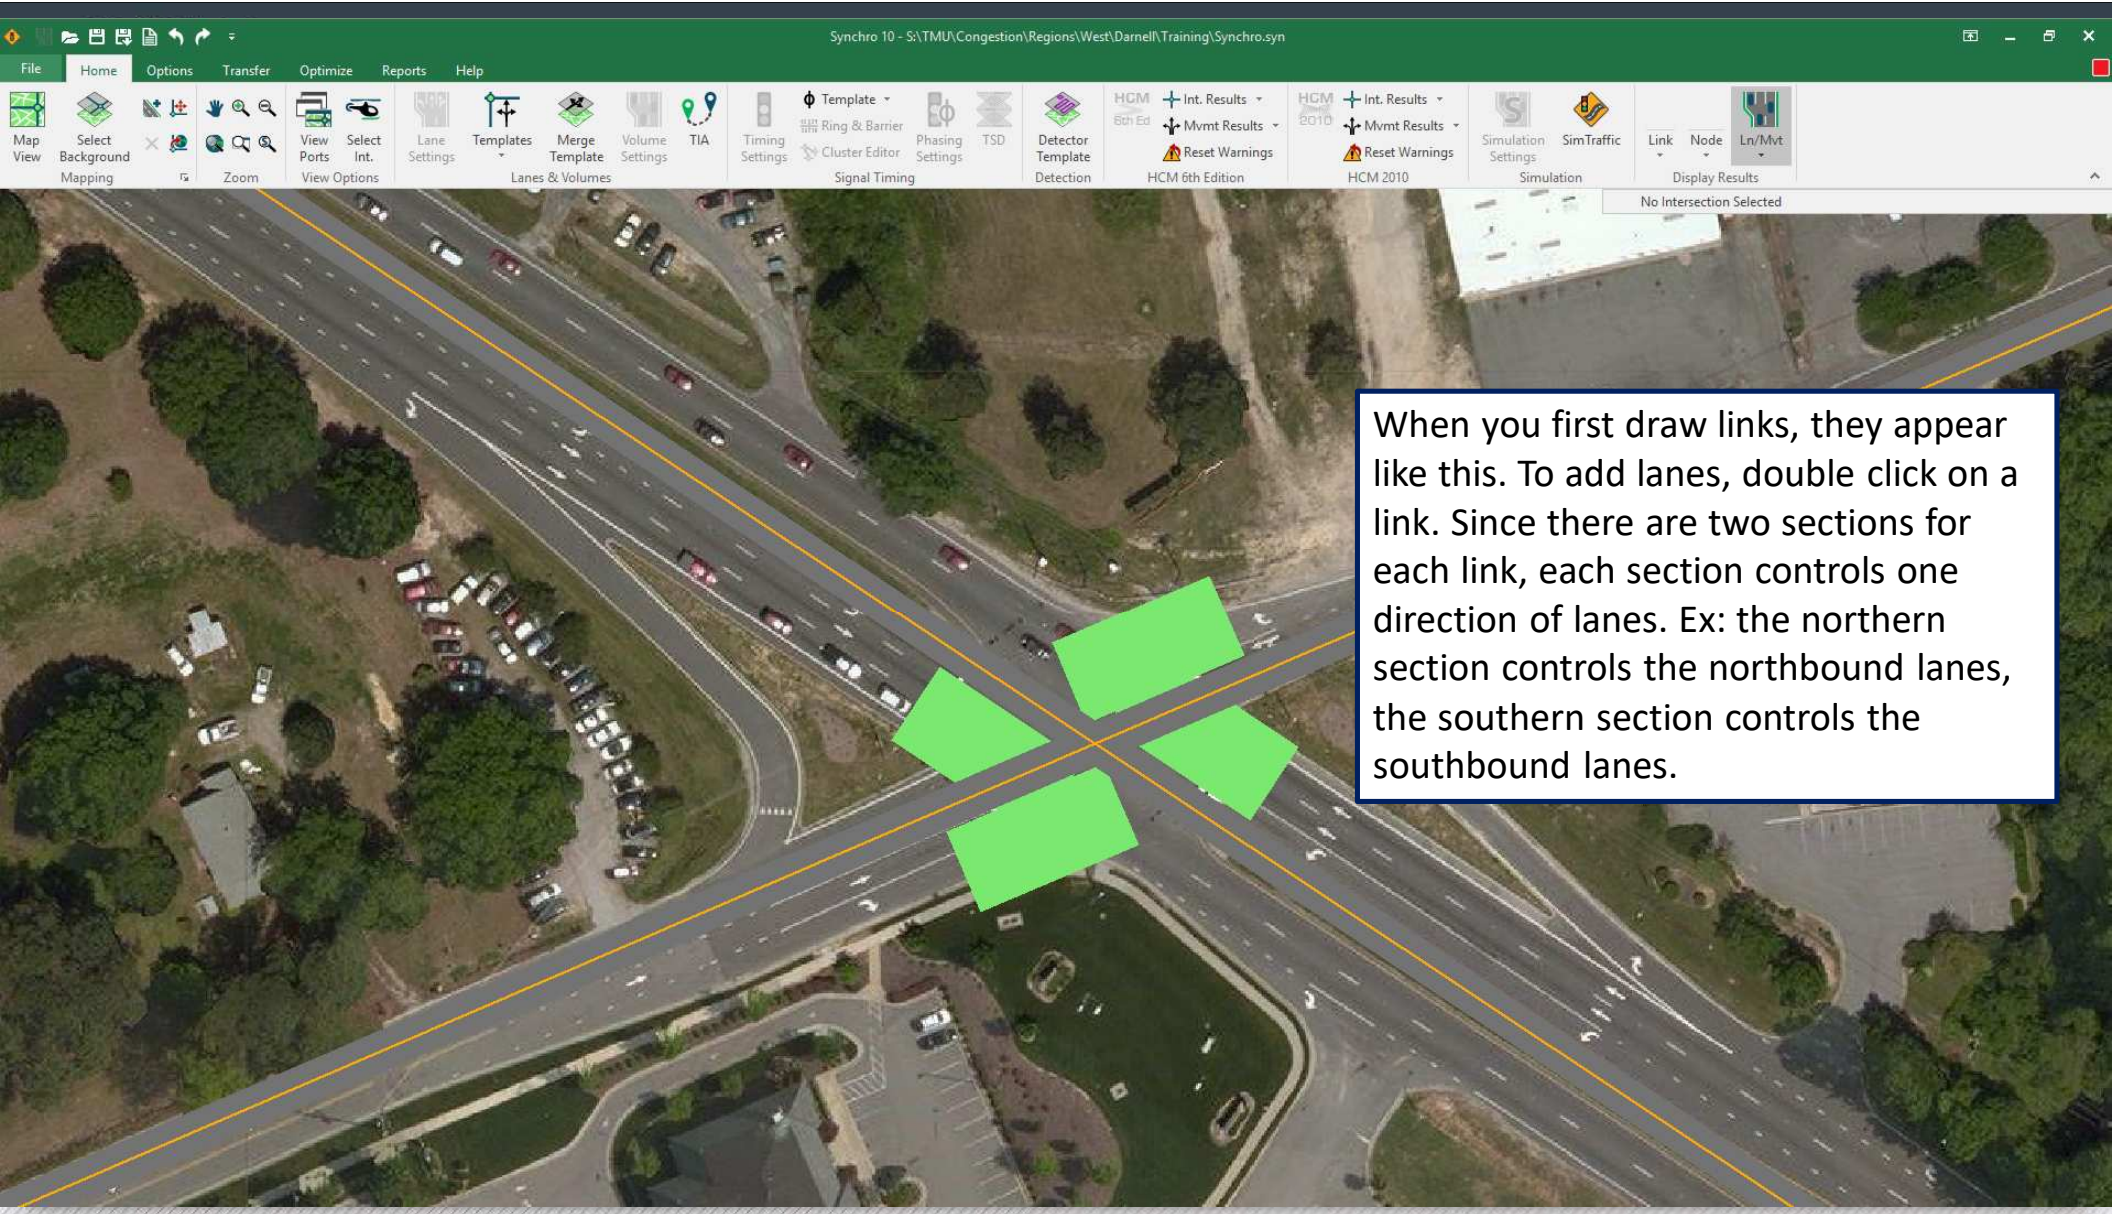

1,155 -50

You can add curvature to a link by right-clicking on it and then click "Add Curvature". When a link has curvature, then any new links drawn over the curved link will NOT connect as an intersection. This is a helpful tool if you don't want the links to connect, like with overpasses. If you have curvature and need to connect a new link; simply right-click the link again and select "Remove Curvature"

This is a link. Each link has two sections. If a link is vertical, then the top half is the northern part of the link, bottom half is southern

When you first draw links, they appear like this. To add lanes, double click on a link. Since there are two sections for each link, each section controls one direction of lanes. Ex: the northern section controls the northbound lanes, the southern section controls the southbound lanes.

LANE SETTINGS

	NWL	NWT	NWR
Lanes and Sharing (HRL)

This is the Timing Settings screen. First step is to determine your control type. See the Timing Signals Training Module for a description of each type. For closely-spaced signals (<1/2 mile), our default is to use "Actd-Coord"

To continue, traffic movement volumes need to be entered. You can do so on this screen. You can also enter volumes in the map view, lane settings view, and simulation settings view.

Enter volumes in the second row where it says "Traffic Volume". The volume entered is for the movement, not the lane. Ex: The westbound direction has a shared left/through lane. Volumes for the left-turn movements will still be entered under the WBL column even though there isn't a dedicated WBL lane.

The following settings come from the Capacity Analysis Guidelines

Left turns can be permitted (perm) unless protected phasing exists or one of the following apply, then, use protected only:

For analysis, generally use protected left-turn treatment instead of permitted when:

- Dual left-turn lanes are present
- Hourly volume exceeds 240 cars
- Left-turn lanes are crossing 3 or more opposing through lanes of traffic
- When a condition is satisfied in the table below:

Number of Opposing Lanes (Through and Right)	Condition
1	Left-Turn Volume * Opposing Volume > 50,000
2	Left-Turn Volume * Opposing Volume > 90,000
3 or more	Left-Turn Volume * Opposing Volume > 110,000

Signal Phasing and Timing

Recommended Timing Settings*	
Timing Setting	Time (seconds)
Minimum Initial Green Time, Protected Left Turns and All Side Street Movements	7
Minimum Initial Green Time, Major Street Through Movements ≤ 35 mph	10
Minimum Initial Green Time, Major Street Through Movements 36-45 mph	12
Minimum Initial Green Time, Major Street Through Movements > 45 mph	14
Yellow Time*	5
All-Red Time*	2
Lost Time Adjustment (Synchro)	-2
Total Lost Time*	5
Minimum Split	Minimum Initial Green Time (or Pedestrian Walk + Clearance) + Yellow Time + All-Red Time

* Increase clearance and lost time as needed for large cross sections such as single point urban interchanges (SPUI).

*Minimum Split is Minimum Initial + 7 seconds if 5 and 2 Y and AR are used (unless ped phase)

Recall Mode should be "None" for side streets and "C-Min" for major streets (or "Min" if signal is not coordinated)

Cycle Length is based on how many total possible (NEMA) phases there are. In this example, there are five total phases:

1. Phase 1 (SBL) runs with Phase 5 (NBL)
2. Phase 1 (SBL) runs with Phase 6 (SBT)
3. Phase 5 (NBL) runs with Phase 2 (NBT)
4. Phase 2 (NBT) runs with Phase 6 (SBT)
5. Phase 4 (EB) runs with Phase 8 (WB)

There can also be right-turn overlap where the right-turns run with nonconflicting left-turns. This option is permitted + overlap (pm+ov)

The “Natural Cycle” is generally the cycle length where the signal runs with the least amount of delay. If this number is greater than the minimum cycle length in our guidelines, then click “Optimize Cycle Length” to use this length. Otherwise, use our minimum as shown below. “Optimize Splits” should always be clicked. This optimizes how much green time each phase in order to achieve the best LOS/delay. This is based on the traffic volumes.

Recommended Minimum Cycle Lengths by Phase

Number of Phases	Minimum Recommended (seconds)**
2	60
3	90
4 or more*	120

Maximum recommended cycle length is 180, but circumstances may warrant cycle lengths up to 240 seconds.

* Traffic Signal Timing Manual (FHWA) for planning level analysis.

** All cycle lengths should be rounded to the nearest 5 seconds.

			Fuel Used (g/hr)			1	1	1	—	2	1	2	16	1	1	24	1			

Side Notes:

- It's not typical for our level of analysis, but signals can have different cycle lengths in the AM peak hour than in the PM peak hour. As long as it is greater than the minimum cycle length in the Guidelines.
- If you have multiple signals (that are coordinated) then all of the signals should have the same cycle length. Half cycles can be used when appropriate. Meaning one signal's cycle length could be 120 sec (4 or more phases) while the next is 60 sec (2 phases). See next slide for multi-signal optimization.

☐ Write Timing File

File Name: S:\TMU\Congestion\Regions\West\Damell\Training\Tmin Browse...

Timing Plan: OptCycle

To optimize multiple signals, go to the optimize tab at the top, then click "Cycle Length" under the Network section. This window will then appear. Choosing automatic will change the cycle lengths after calculating the best length. Choosing manual will show you the cycle lengths with corresponding delay and will then allow you to choose the cycle length (adhere to minimums).

After optimizing the "Cycle Length" of the network of signals, click "Offsets" to optimize the offsets for a given reference phase (typically "2+6"). Optimization can be performed for the "Entire Network" or by defined "Zone".

This screen is "Lane Settings". On this screen you can edit the traffic volumes, street names, speed limits and storage lengths, amount of storage lanes, right-turn channelization, right-turn on red (RTOR).

Similarly, the "Volume Settings" screen can be used to key in Heavy Vehicle percentages, peak hour factors, and Growth Factor (if applicable)

Storage lengths do not affect Synchro outputs, however, it does effect SimTraffic simulation. Storage lengths can be measured using Google Maps. Storage lanes have the storage length and a taper length. We use a default taper length of 100 ft. Storage length is generally the length of the full width lane (before taper begins) or solid white line, however, sometimes the white skip lines can be included within storage. The length should be rounded to the nearest multiple of 25.

An aerial photograph of a road intersection. A red bracket is drawn across the intersection, indicating a storage length. The text '250'' is written in red below the bracket. The image shows a multi-lane road intersecting with another road, with surrounding greenery and buildings.

250'

An aerial photograph of a road intersection. A red arrow points from a text box to a specific lane at the intersection. The lane is a right-turn lane that is separated from the main traffic flow by a grassy area and a curb, forming a 'channelized' right-turn. The surrounding area includes trees, parking lots, and some buildings.

This is called a channelized right-turn. Synchro has an option in the "Lane Settings" tab to enter in channelization. These right-turn lanes will still have storage length. Channelization will only affect SimTraffic.

This is called a channelized right-turn. Synchro has an option in the “Lane Settings” tab to enter in channelization. These right-turn lanes will still have storage length. Channelization will only affect SimTraffic.

Curb Radius (ft)	—	—	—	—	—	—
Add Lanes (#)	—	—	—	—	—	—

Notice the westbound approach drops as a right-turn lane and has a left/through storage lane. In Synchro, you cannot enter storage for a through lane, so you instead enter in the storage length under the left-turn lane even though there isn't one. You first enter in the length, then enter in "1" under "Storage Lanes (#)". It will appear in a red color, but Synchro will code it correctly.

This trick can also be used when an intersection picks up an additional through lane. Instead of 1 under "Storage Lane (#)", you would put 2.

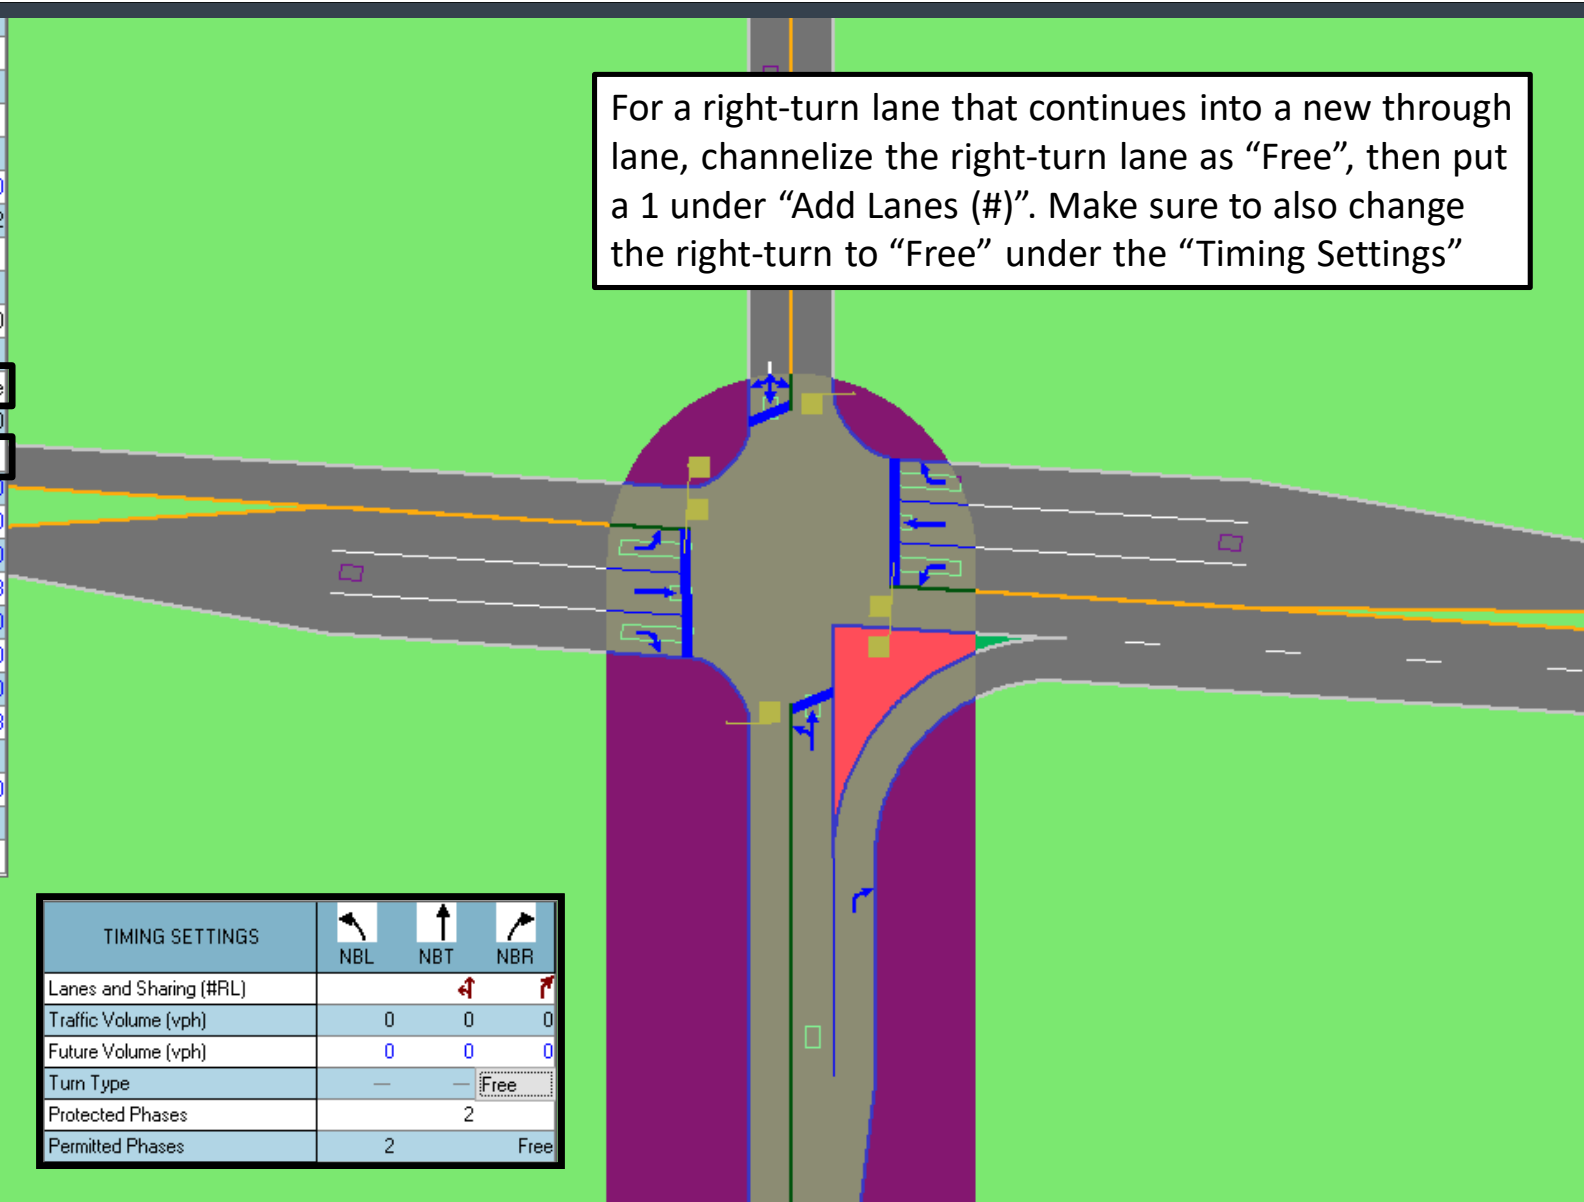

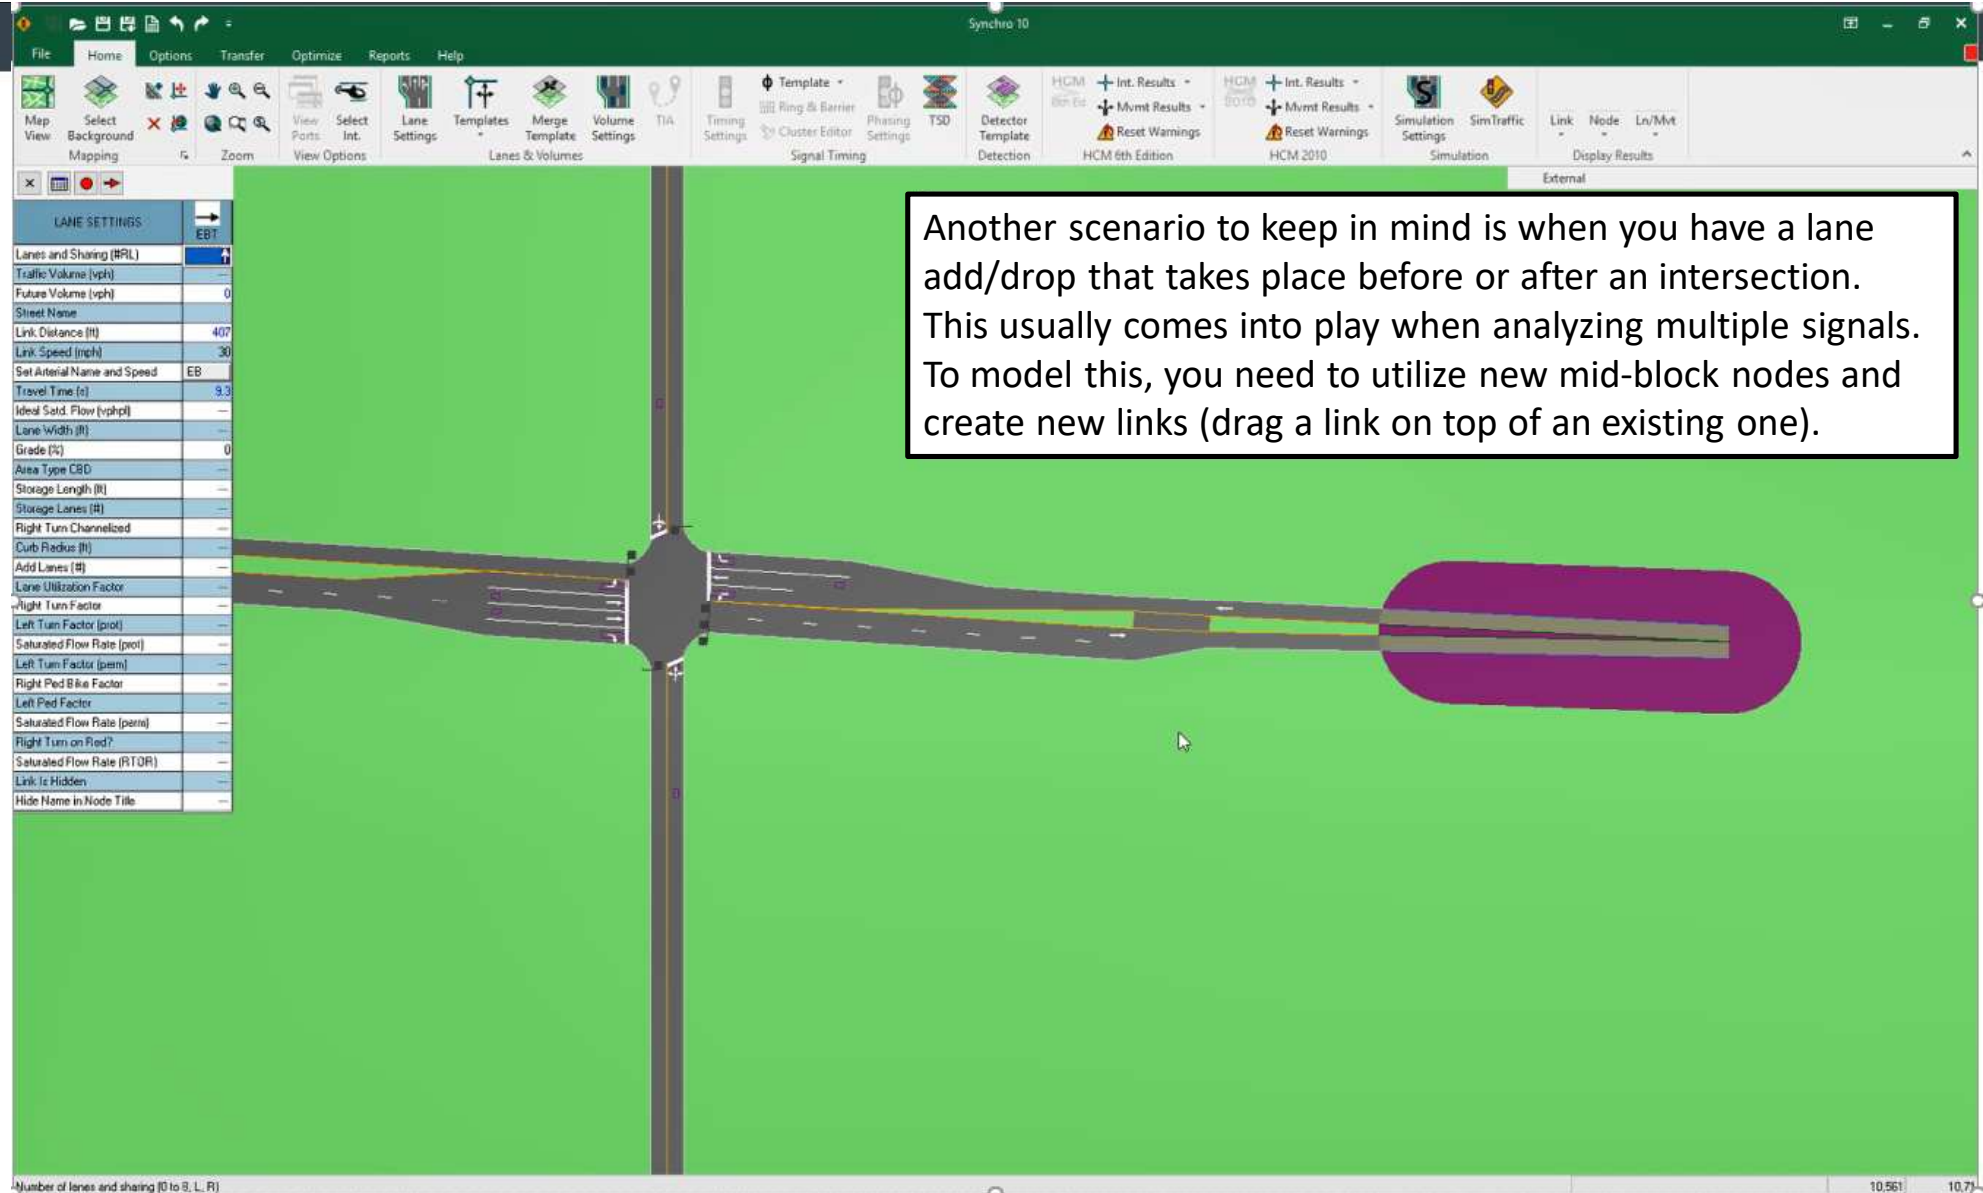

Another scenario is having a channelized right-turn lane that then continues on as its own lane.

Use "Error Check" and resolve errors and warnings before running SimTraffic.

This is what our example looks like now. Now that the Synchro part is complete and optimized, run SimTraffic simulation.

After SimTraffic opens, go to the Calibration tab then click "Intervals & Volumes". Under seeding duration, enter at least 10, or the amount of time for vehicles to traverse the network. This is how long cars are fed into the network. Under recording duration, enter in 60. This is how long the simulation records. Now click Ok.

What do the # and ~ symbols mean?

These indicate possible underestimation of the queuing results, and further information or study is needed.

Therefore, we will need to take a closer look at the SimTraffic Maximum Queue. Nevertheless, we look at the Maximum Queue for all of the lanes.

SimTraffic Maximum Queue

Recommendations Summary

	Synchro 95th Queue (ft)	SimTraffic Max Queue (ft)	Number of lanes	Existing Storage length (ft)	Proposed Storage length (ft)
NBL (US 70)	#167	160	1	250	250
EBL (Yeargan Rd)	#121	115	1	100	125

Feed These Storages Back Into SimTraffic

New 95th Queue and SimTraffic Queue

	Synchro 95th Queue (ft)	SimTraffic Max Queue (ft)	Number of lanes	Old Storage length (ft)	New Storage length (ft)
NBL (US 70)	#167	168	1	250	250
EBL (Yeargan Rd)	#121	119	1	100	125

*Note: One passenger vehicle is approximately 25 feet
Per Guidelines, minimum turn lane storage length is 100 feet

Site Development and Highway Access Classes

<https://itre.ncsu.edu/training/highways/>

Spring 2020 Classes to be rescheduled due to COVID-19

2020 Classes planned for Charlotte, Raleigh (2), and Winston-Salem

Site Development and Highway Access - What You Need to Know

Day One: Site Development & Highway Access - Introduction: This introductory one-day class is meant to be a comprehensive overview to conventional and modern site development and highway access principles discussed in the NCDOT Driveway Access Manual and associated manuals and policies. **This class is intended to serve as a prerequisite and foundation to the practitioner level class.**

Day Two: Site Development and Highway Access - Practitioner: This advanced one-day class is meant to familiarize engineers, planners, developers, and local authorities with basic to complex highway access principles, traffic analyses, traffic mitigation recommendations, and the driveway permitting processes, including new details on how to develop/review TIAs based on new legislation, policy, standards, and guidelines. **For best class attendee results, it is strongly recommended the introductory level site development and highway access class should have been attended within the last two years.**

Course Fee: \$100 per day. Classes can be taken separately or concurrently. Registration is separate for each course offering above!

PDHs: Each participant will receive 7.0 Professional Development Hours (PDHs) per day which will be noted on his or her training certificate(s).

Intro. Classes:

- Charlotte–Apr. 21, 2020
- Raleigh–June 24, 2020
- Winston-Salem–Sep. 22
- Raleigh–Nov. 17, 2020

Practitioner Classes:

- Charlotte–Apr. 29, 2020
- Raleigh–July 14, 2020
- Winston-Salem–Oct. 13
- Raleigh–Dec. 8, 2020

Who should attend:

- Public and private sector traffic engineers and planners
- NCDOT District and traffic engineering staff
- Local government, planning, transportation and traffic staff
- TIA preparers and site developers

Course Instructors:

Mike Reese, PE, CPM is a Congestion Management Regional Engineer in the NCDOT Transportation Mobility and Safety Division. Mike's extensive experience reviewing and performing traffic impact analyses and traffic studies in the Traffic Management Unit provides insight and clear expectations when reviewing permits and TIAs.

Chuck Edwards, PE is currently a District Engineer in the NCDOT Field Operations for Division 7, District 1 responsible for the greater Burlington and Chapel Hill areas. Chuck's extensive field experience within the Division provides a unique perspective to those participating in the workshop.

Locations and Directions will be given by confirmation via e-mail one month prior to the workshop!

For registration, future classes, and complete information visit <https://itre.ncsu.edu/training/highways/> or contact: **Walt Thomas** at wthomas@ncsu.edu or (919) 515-8893.

Sponsored by Institute for Transportation Research and Education (ITRE) NC State University • Centennial Campus • Raleigh, NC
NCDOT employees must register through their training coordinators

Questions?

NCDOT Congestion Management Capacity Analysis Guidelines

Introduction/Purpose

This document provides standard values to ensure consistent traffic analysis. Deviation from these practices requires justification. By reviewing reports, plans, and submittals, the North Carolina Department of Transportation (NCDOT) in no way relieves the analyst of possible claims or additional work resulting from errors or omissions.

Pre-Analysis

Submittal Document Requirements

The submitted traffic analysis document should include, but is not limited to: a summary of the analysis and results, site plans, traffic counts and forecasts, volume generation, any assumptions used in the analysis, and any variations from these guidelines.

TIA	TIP
Summary of Results	Summary of Results
Site Plan	Traffic Forecasts
Traffic Counts and Forecasts	Traffic Breakouts (Existing, No Build, Build)
Existing Lane Diagram	Traffic Adjustments and Reroutes

Michael P. Reese, P.E., C.P.M.
